UNITED WORLD LLC

PROJECT SHOWCASE / OCTOBER 2026

SPIN & WIN

A responsive promotional web app
with server-side prize selection and spreadsheet records.

HTML / CSS / JavaScript | Google Apps Script | Google Sheets

Prepared as a source-based handover and GitHub-ready project package.

LIVE APPLICATION Open current web app (production; submissions save to live sheet)

What the project does

A live campaign microsite that turns a promotional interaction into a trackable registration and reward record.

Project purpose

Invite prospective program participants to register, spin a branded prize wheel, and receive a configured discount/reward. Keep prize assignment and the one-spin rule on the server, and store a traceable record for staff.

PARTICIPANT EXPERIENCE

Responsive landing page, registration form, animated wheel, reward modal, and program overview.

SERVER RULES

Required field checks, Entry ID, duplicate pair check, promotion end date, and one-spin limit.

DATA RECORD

One row per accepted registration; prize columns filled when the server approves the spin.

What is in scope today

- The first tab, Spin Records, is the only tab referenced by the current server code.
- Prize Summary and Dashboard exist in the workbook but are not automatically populated yet.
- The website has been tested end-to-end by the owner; the final mobile layout was reported as working.

Build journey

01 **Brand + UI**

02 **Apps Script bridge**

03 **Sheet persistence**

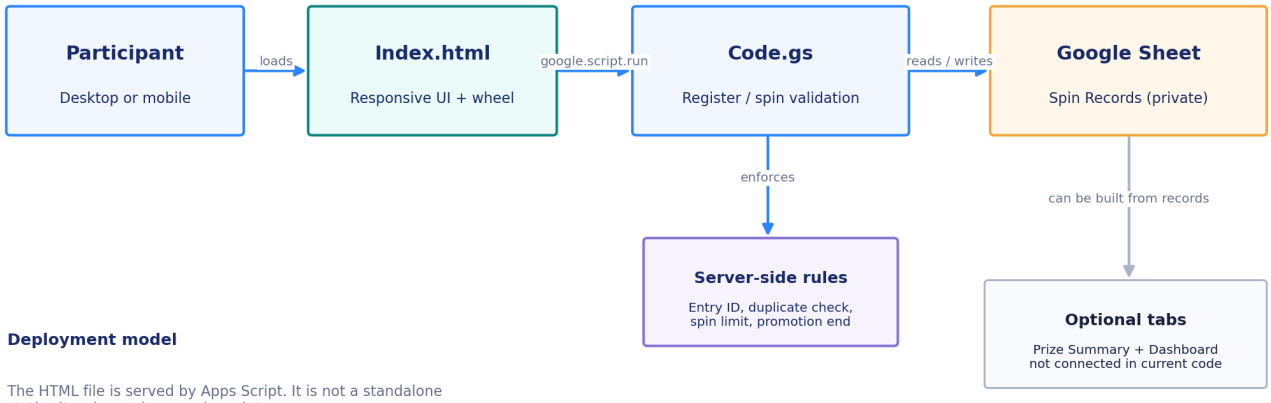

04 **Mobile refinement**

Architecture and responsibilities

The project uses the Google Apps Script HTML Service rather than a separate hosted frontend and API.

SYSTEM ARCHITECTURE

A small serverless web app with private spreadsheet storage

Deployment model

The HTML file is served by Apps Script. It is not a standalone static site when using google.script.run.

Component responsibilities

Component	Responsibility
Index.html	Responsive participant interface; form validation; wheel animation; invokes server functions via google.script.run.
Code.gs	Creates entries, blocks duplicate email + phone pairs, checks the one-spin and end-date rules, chooses prize, writes the result.
Spin Records	Private source-of-truth tab for registration fields and reward lifecycle.
Prize Summary / Dashboard	Optional reporting surfaces in the workbook; not consumed by the current server code.

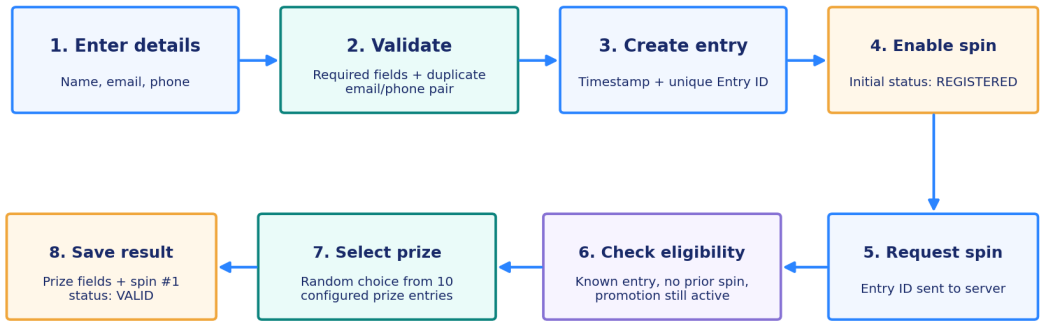

Deployment detail: The HTML calls `google.script.run`. That bridge is available when the file is served by Apps Script HTML Service; a local HTTP server can render the page but cannot provide the production registration/spin integration.

Participant journey and enforcement

Prize selection is made by the server and written to the spreadsheet before the client displays the confirmed result.

PARTICIPANT JOURNEY

Registration and prize assignment are handled as separate server-side actions

Key rule

The browser animates the wheel, but the prize is chosen and saved by Code.gs. Repeated spin requests are rejected server-side.

Rules enforced by the current backend

- Registration: name, email, and phone must all be non-empty after trimming; email is stored in lowercase.
- Duplicate check: an existing record is detected when both email and phone match. This is a basic duplicate guard, not identity verification.
- Spin eligibility: the Entry ID must exist, the promotion must be active, and Spin Number must be below 1.
- Result: one of 10 configured array entries is selected; Prize Code, Prize, Prize Value, Spin Number, Valid Until, and Status are updated.
- Concurrency: `LockService.getScriptLock()` helps serialize simultaneous writes in the register/spin functions.

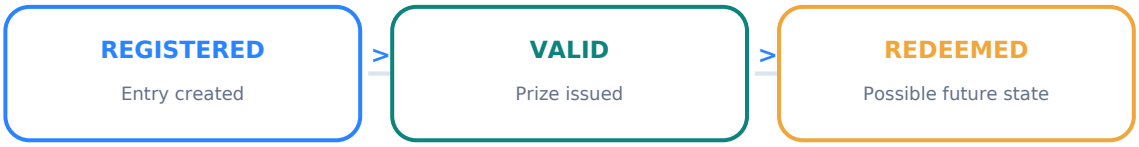

Current statuses: REGISTERED after registration and VALID after a successful spin. A redemption workflow and a `REDEEMED` transition are not implemented yet.

Spreadsheet schema

Keep the sheet tab name and column order stable because the code reads fixed column indexes.

Column	Field	Meaning / behavior
A	Timestamp	Registration time captured by Apps Script.
B	Entry ID	Generated identifier similar to UW-YYYYMMDD-000123.
C	Full Name	Participant-provided name.
D	Email	Trimmed and lowercased before save; used in duplicate matching.
E	Phone	Trimmed phone string; used in duplicate matching.
F	Prize Code	Blank before the spin; filled after a successful spin.
G	Prize	Prize display name stored for staff review.
H	Prize Value	Configured numeric value of the prize.
I	Spin Number	0 at registration; set to 1 after a successful spin.
J	Valid Until	Promotion end date. Current code sets February 1, 2027.
K	Status	REGISTERED or VALID in the current code.

Record lifecycle

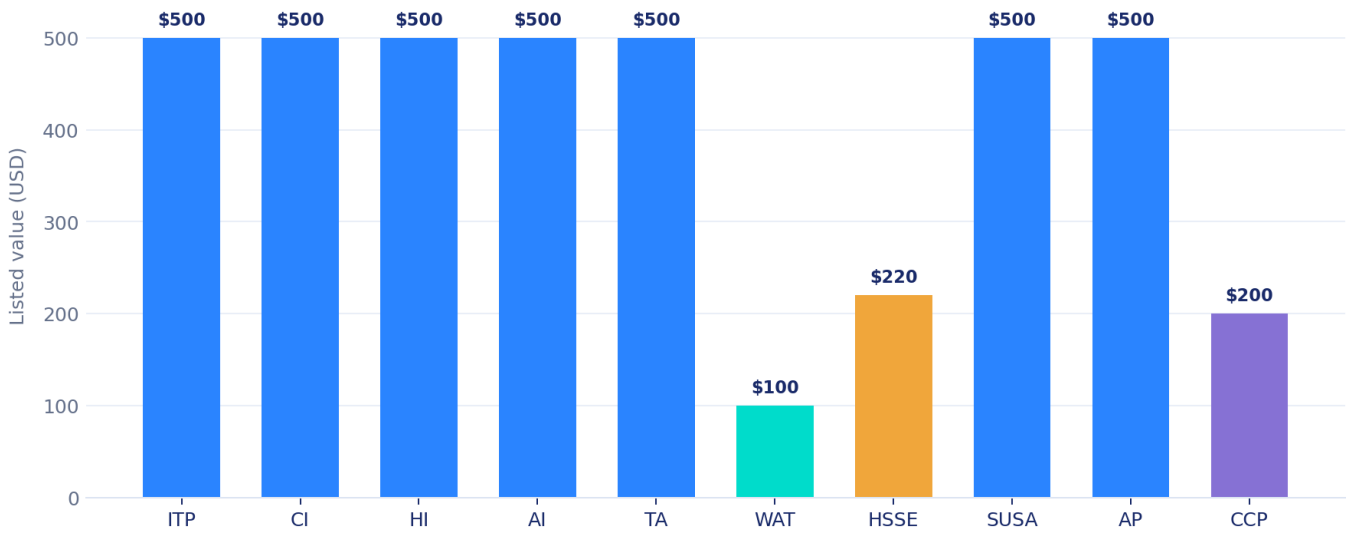

Important operational note

The workbook contains personal contact information. Keep it private, grant access only to authorized staff, avoid screenshots with live participant rows in a public repo, and use a sandbox spreadsheet for tests.

Prize pool visualization

The following chart comes from the configured source-code prize list. It is not a chart of historical winners.

Configured prize values by prize code

10
Configured prize entries

$4,020
Sum of listed values

$402
Mean listed value

How to read this chart

- Seven prize entries are configured at $500; WAT is $100, HSSE is a $220 SEVIS fee, and CCP is $200.
- The source code draws an integer index uniformly from the 10-entry array. That gives each list entry an equal nominal chance in the current implementation.
- The values are configured descriptions and should be checked against the official campaign terms. They do not represent actual redeemed value or financial liability.

If prize terms change, update the backend list and inspect the wheel labels in Index.html together. Test the returned prize code/value and the displayed wheel sector before redeploying.

Step-by-step deployment

This is the manual workflow used for the current Google Sheets-bound Apps Script deployment.

01

Prepare the spreadsheet

Create a tab named exactly `Spin Records`. Put the 11 schema headers from page 5 in row 1. Do not share the sheet publicly.

02

Open Apps Script

From the spreadsheet choose Extensions > Apps Script so the script stays bound to the correct spreadsheet.

03

Install the source files

Paste `apps-script/Code.gs` into Code.gs. Add an HTML file named `Index` and paste `apps-script/Index.html` into it. Save.

04

Deploy as a web app

Choose Deploy > New deployment > Web app. Choose execution identity and access policy appropriate for your campaign. Authorize access.

05

Test the deployed /exec URL

Use a sandbox deployment first. Register once, spin once, inspect the row in Spin Records, then confirm a second spin is rejected on both desktop and mobile.

Updating an existing deployment

Use Deploy > Manage deployments, edit the web app deployment, select a new version, and deploy. Then reopen the `/exec` URL and repeat the test checklist.

Testing and troubleshooting

Test from a separate spreadsheet / deployment wherever possible so test contact details do not enter production records.

Test	Expected result
Valid registration	A row is appended with Entry ID, timestamp, Spin Number 0, Status REGISTERED.
Missing required field	Registration is rejected and no new row should be created.
Same email + same phone	A second registration is rejected as already registered.
First spin	Prize fields are populated, Spin Number becomes 1, Status becomes VALID.
Second spin	Server rejects the request as already used.
Unknown Entry ID	Server returns an entry-not-found error.
Promotion expired	Server rejects the spin after the configured end datetime.
Mobile viewport	Form appears before/with the wheel in the intended single-column flow and controls remain usable.

Common issues

Page shows old version

Confirm you deployed a new version, then refresh/reopen the /exec URL.

“Sheet not found”

Verify the Apps Script is bound to the intended spreadsheet and the tab is exactly named `Spin Records`.

Registration/spin is stuck or fails

Check Apps Script Executions and error details. Confirm the HTML calls the function names `registerParticipant` and `spinWheel`.

Local preview cannot submit

Expected: `google.script.run` only works inside Apps Script HTML Service. Test integration with the deployed app.

Mobile looks different

Retest the exact published HTML and verify the viewport meta + mobile-device logic were copied unchanged.

GitHub repository and source walkthrough

This package is prepared for upload under your GitHub account; it is not yet a remote GitHub repository.

Repository map

```
united-world-spin-win/
  README.md
  apps-script/Code.gs
  apps-script/Index.html
  assets/united-world-logo.jpg
  screenshots/desktop-preview.png
  screenshots/mobile-preview.jpg
  docs/PROJECT_GUIDE.pdf
  docs/architecture.png
  docs/participant-flow.png
  docs/prize-values.png
  docs/dashboard-concept.png
```

Publish steps

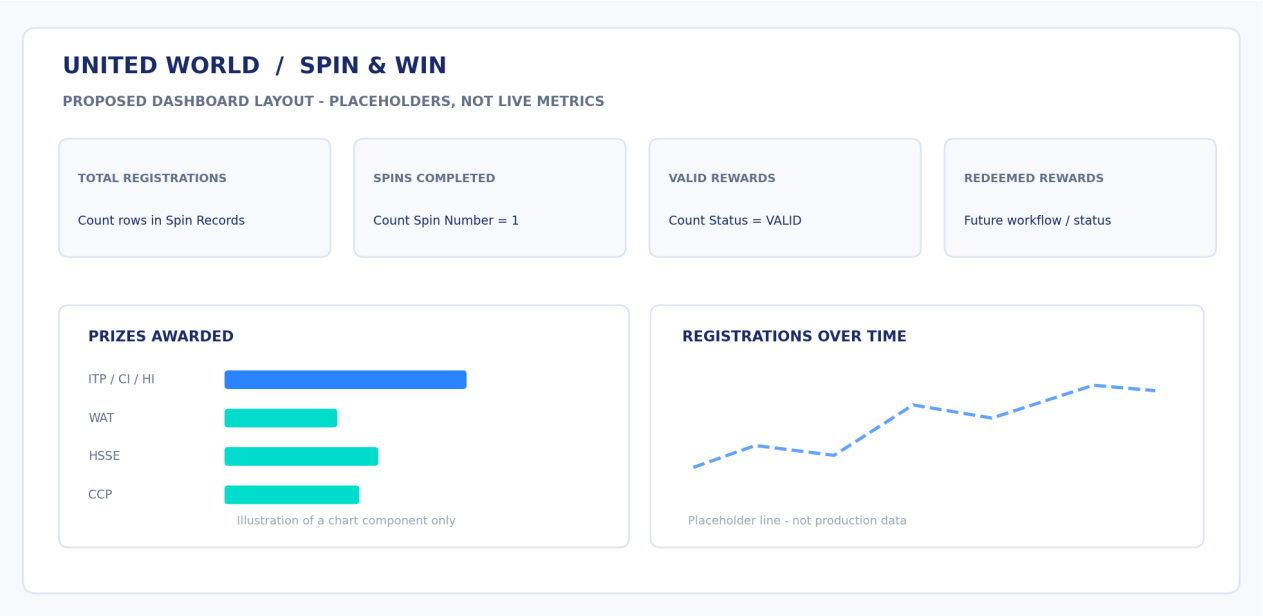

- 1. On GitHub, create an empty repository named `united-world-spin-win`.
- 2. Extract the provided ZIP, open a terminal in the project folder, and run:

```
git init
git add .
git commit -m "Initial project showcase"
git branch -M main
git remote add origin https://github.com/YOUR_USERNAME/united-world-spin-win.git
git push -u origin main
```

Before making the repository public, review the code and screenshots, follow company policies, and ensure no participant records or private credentials are included. The spreadsheet itself should stay private.

Future dashboard and next steps

The Dashboard and Prize Summary tabs can be developed as reporting layers without replacing Spin Records as the source of truth.

Suggested future dashboard metrics

Metric	Potential source / definition	Status
Total registrations	Count registration rows in Spin Records.	Future
Spins completed	Count rows where Spin Number = 1.	Future
Prize distribution	Group by Prize Code after a successful spin.	Future
Registration trend	Group Timestamp by day/week.	Future
Valid rewards	Count Status = VALID.	Partly stored
Redeemed rewards	Requires staff redemption action and status transition.	Not implemented

Recommended order of work

- 1. Preserve the working app and create a test copy of the spreadsheet/script before enhancements.
- 2. Add summary formulas/charts to Prize Summary using the live record schema, then validate the counts.
- 3. Build a Dashboard with dates, prize codes, and statuses; avoid exposing participant names, emails, or phones.
- 4. If rewards need redemption tracking, define who can redeem, add an auditable staff action, and implement status changes deliberately.

Guiding principle: keep the participant experience simple, keep eligibility logic server-side, and make operational reporting read from the private source-of-truth sheet.
